- Handling dynamic resizing

In-Depth Look at Key Solutions

Dynamic Programming: Longest Common Subsequence

One of the classic problems solved by Drozdek is the Longest Common Subsequence (LCS). The solution involves:

- Defining the subproblem: LCS of prefixes of the two strings.
- Using a 2D table to store intermediate results.
- Filling up the table based on character matches or mismatches.
- Backtracking to find the actual subsequence.

Pseudocode:

...

Initialize table L with dimensions $(\text{len}(X)+1) \times (\text{len}(Y)+1)$

for i from 0 to $\text{len}(X)$:

for j from 0 to $\text{len}(Y)$:

if $i == 0$ or $j == 0$:

$L[i][j] = 0$

else if $X[i-1] == Y[j-1]$:

$L[i][j] = L[i-1][j-1] + 1$

else:

$L[i][j] = \max(L[i-1][j], L[i][j-1])$

Backtrack from $L[\text{len}(X)][\text{len}(Y)]$ to reconstruct LCS

...

This solution exemplifies how dynamic programming reduces exponential complexity to polynomial time.

Tree Traversal Algorithms

Drozdek's solutions to tree traversals are foundational. For example, in-order traversal involves:

- Visiting the left subtree
- Visiting the current node
- Visiting the right subtree

Recursive implementation:

```
```python
```

```
def in_order_traversal(node):
```

```
 if node is not None:
```

```
 in_order_traversal(node.left)
```

```
 print(node.data)
```

```
 in_order_traversal(node.right)
```

```
```
```

These traversals are crucial for tasks like expression tree evaluation and BST validation.

Graph Algorithms: Dijkstra's Algorithm

Drozdek's detailed explanation of Dijkstra's algorithm helps users understand shortest path computations in weighted graphs.

Key steps:

- Initialize distances from source to all vertices as infinity.
- Set the source's distance to zero.
- Use a priority queue to select the vertex with the smallest tentative distance.
- Update the distances of adjacent vertices if shorter paths are found.
- Repeat until all vertices are processed.

Pseudocode:

```
```
```

```
dist[] = infinity
```

```
dist[source] = 0

priority_queue = initialize with source

while priority_queue not empty:

 u = extract_min(priority_queue)

 for each neighbor v of u:

 if dist[u] + weight(u,v)
 dist[v] = dist[u] + weight(u,v)

 update priority_queue with new dist[v]

...

```

This solution demonstrates efficient shortest path calculation in graphs.
