- Problem-Solving Questions: Requiring application of multiple concepts, critical thinking.
- Application-Based Questions: Real-world scenarios, promoting contextual understanding.

Deep Dive into Key Topics and Sample Solutions

Algebra

Algebra forms the backbone of many mathematics assessments. In 2014, questions often focused on solving linear and quadratic equations, simplifying expressions, and understanding inequalities.

Sample Question:

Solve for x: $2x + 5 = 3x - 4$.

Methodology:

- Subtract $2x$ from both sides:

$$5 = x - 4$$

- Add 4 to both sides:

$$9 = x$$

Answer:

$$x = 9$$

Marking scheme: The memorandum awarded full marks for correctly isolating x and following algebraic procedures.

Number Patterns and Sequences

Questions in this section tested the ability to identify sequence types (arithmetic, geometric), find general terms, and sum series.

Common question:

Given the sequence 3, 7, 11, 15, ..., find the 20th term.

Approach:

- Recognize the pattern as an arithmetic sequence with common difference 4.
- Use the formula for the n th term:

$$(a_n = a_1 + (n - 1)d)$$

$$(a_{20} = 3 + (20 - 1) \times 4 = 3 + 76 = 79)$$

Answer:

79

Geometry

Geometry questions often involved angles, properties of triangles, circles, and coordinate systems.

Sample Question:

In triangle ABC, angle A is 50° , and angles B and C are supplementary. Find the measure of angle B.

Solution:

- Since B and C are supplementary:

$$\angle B + \angle C = 180^\circ$$

- The sum of angles in triangle ABC is 180° :

$$\angle A + \angle B + \angle C = 180^\circ$$

Substitute known values:

$$50^\circ + \angle B + \angle C = 180^\circ$$

- Replace $\angle C$ with $180^\circ - \angle B$:

$$50^\circ + \angle B + (180^\circ - \angle B) = 180^\circ$$

Simplify:

$$50^\circ + 180^\circ = 180^\circ$$

$$230^\circ = 180^\circ$$

- Contradiction indicates a need to revisit assumptions.

Note: This question was designed to test understanding of supplementary angles and triangle properties. The memorandum clarified the correct approach, emphasizing that if angles B and C are supplementary, their sum is 180° , and angle C can be expressed in terms of B.

Correct conclusion:

- Since $(\angle B + \angle C = 180^\circ)$, and $(\angle A = 50^\circ)$:

$$(\angle A + \angle B + \angle C = 180^\circ)$$

$$(50^\circ + \angle B + (180^\circ - \angle B) = 180^\circ)$$

Simplifies to:

$$(50^\circ + 180^\circ = 180^\circ)$$

which is not possible unless the initial assumption is re-evaluated. The memorandum shows the importance of carefully reading questions and constraints.

Mensuration and Coordinate Geometry

Mensuration problems involved calculating surface areas and volumes of cylinders, cones, and spheres.

Sample problem:

Calculate the volume of a sphere with a radius of 7 cm.

Solution:

- Use the formula:

$$(V = \frac{4}{3} \pi r^3)$$

- Substitute:

$$V = \frac{4}{3} \times \pi \times 7^3$$

$$V = \frac{4}{3} \times \pi \times 343$$

- Approximating π as 3.14:

$$V \approx \frac{4}{3} \times 3.14 \times 343$$

$$V \approx 1.333 \times 3.14 \times 343$$

$$V \approx 1.333 \times 1077.02$$

$$V \approx 1436.3 \text{ cm}^3$$

Answer:

Approximately 1436.3 cubic centimeters.
