These methods enable precise identification of mineral phases, textures, and associations, which directly influence process choices.

The section underscores that ore characterization impacts everything from comminution energy requirements to the selection of separation methods. For instance, the liberation size—a critical parameter—determines the extent of grinding needed before beneficiation.

Comminution and Size Reduction

Comminution involves crushing and grinding to liberate valuable minerals from gangue. The handbook discusses various equipment—jaw crushers, cone crushers, ball mills, SAG mills—and their operational principles. It highlights the importance of energy efficiency, process optimization, and wear management.

A thorough analysis of the physics behind size reduction is provided, explaining how particle size distribution affects downstream processes. The authors also explore recent advancements in

high-pressure grinding rolls (HPGR) and stirred media mills, which promise energy savings and improved liberation.

Physical Separation Techniques

This section delves into methods such as gravity separation, magnetic separation, electrostatic separation, and flotation—all vital for upgrading ore concentrates.

- Gravity Separation: Exploits differences in density; techniques include jigging, tabling, and spiral concentrators.
- Magnetic Separation: Utilizes magnetic susceptibility differences; applicable for iron ores and rare earth minerals.
- Flotation: A chemically intensive process where reagents modify mineral surface properties to achieve selective attachment to air bubbles.

The handbook evaluates the effectiveness, limitations, and recent technological innovations in each method. For example, flotation chemistry is explored in depth, with discussions on reagent types, pH control, and froth stability.
