- Compaction: The specimen is carefully compacted to eliminate voids, typically using a tamping rod or mechanical vibrator.
- Curing: After molding, specimens are cured in a controlled environment (usually at 73.5°F or 23°C with 50% relative humidity) for a specified period, often 24 to 48 hours before demolding, then continued curing until testing.

Testing Procedure

- Loading: The specimen is placed in a compression testing machine.
- Application of Load: A gradually increasing load is applied at a specified rate until failure occurs.
- Data Recording: The maximum load sustained before failure is recorded.
- Calculations: The compressive strength is calculated by dividing the maximum load by the cross-sectional area of the specimen.

Result Interpretation

- The average of multiple specimens (usually three) is taken to determine the mortar's compressive strength.
- Results are compared against project specifications or standard minimums to assess compliance.
