- To rigorously define limits, continuity, derivatives, and integrals
- To analyze the behavior of mathematical systems under various operations
- To provide tools for solving real-world problems involving change and accumulation

Branches of Analysis

Analysis is a broad field with several interconnected branches, each focusing on different aspects of mathematical concepts.

Real Analysis

Real analysis deals with real numbers and real-valued functions. It explores the properties of sequences, series, limits, continuity, differentiation, and integration in the context of real numbers.

Complex Analysis

Formally, a function f is continuous at a point c if $\lim_{x \rightarrow c} f(x) = f(c)$.

Differentiation

Differentiation measures how a function changes at a point. The derivative $f'(x)$ indicates the slope of the tangent line to the graph of f .

Integration

Integration accumulates quantities such as area under a curve. The definite integral $\int_a^b f(x) dx$ computes the accumulation of $f(x)$ from a to b .

Sequences and Series

- Sequences: Ordered lists of numbers that approach a limit.
- Series: Sum of the terms of a sequence. Convergence or divergence of series is a central topic in analysis.

Key Theorems and Principles

Several fundamental theorems form the backbone of analysis, providing tools for understanding and solving problems.

Limit Theorems

- Squeeze Theorem: If $f(x) \leq g(x) \leq h(x)$ near a point and $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$, then $\lim_{x \rightarrow c} g(x) = L$.

Continuity Theorems

- Intermediate Value Theorem: If f is continuous on $[a, b]$ and d is between $f(a)$ and $f(b)$, then there exists $c \in [a, b]$ such that $f(c) = d$.

Differentiation and Integration Theorems

- Mean Value Theorem: There exists some $c \in (a, b)$ such that $f'(c) = \frac{f(b) - f(a)}{b - a}$.
