Implementing Network Routing Simulation in MATLAB: Step-by-Step

Let's walk through a typical process of setting up a routing simulation in MATLAB.

Step 1: Creating the Network Topology

Start by defining network nodes and links. MATLAB's graph objects make this straightforward:

```
```matlab

% Define adjacency matrix

adjMatrix = [

0 1 0 0 1;

1 0 1 0 0;

0 1 0 1 0;

0 0 1 0 1;

1 0 0 1 0

];

% Create graph object

G = graph(adjMatrix);

plot(G, 'EdgeLabel', G.Edges.Weight);

```
```

This code constructs a simple undirected network with weighted links, which can be customized for more complex topologies.

Step 2: Implementing Routing Algorithms

For shortest path routing, Dijkstra's algorithm is commonly used. MATLAB's graph object provides built-in functions:

```
```matlab

% Compute shortest path from node 1 to node 5

[startNode, endNode] = deal(1, 5);

[path, totalCost] = shortestpath(G, startNode, endNode);

disp(['Path: ', mat2str(path)]);

disp(['Total cost: ', num2str(totalCost)]);

```
```

For dynamic routing protocols or more sophisticated algorithms, custom functions can be developed, leveraging MATLAB's capabilities to update link costs based on traffic or failures.

Step 3: Simulating Traffic and Data Transmission

Generate traffic patterns and simulate packet traversal:

```
```matlab

% Sample traffic source

numPackets = 100;

destNode = 5; % Destination node

for i = 1:numPackets

 sourceNode = randi([1, size(G.Nodes,1)]);

 [path, ~] = shortestpath(G, sourceNode, destNode);

 % Log the path and simulate delays

end
```

% Additional code can model packet delays and loss

end

```

This simulation can be extended to incorporate queuing, bandwidth constraints, and packet loss modeling.

Step 4: Analyzing Performance

Collect data during simulation to evaluate key metrics:

```matlab

% Example: calculating average path length

pathLengths = [];

for each simulated packet

pathLength = length(path) - 1; % Number of hops

pathLengths(end+1) = pathLength;

end

avgHops = mean(pathLengths);

disp(['Average number of hops: ', num2str(avgHops)]);

```

Similarly, delays and throughput can be analyzed using statistical methods and MATLAB's visualization tools.
